This is a closed book test. No electronic devices are allowed. If two students submit exams in which any solution has been copied, **both students will receive a score of zero**. There are 5 pages and 5 problems, each worth 6 points.

**Problem 1.** Let  $\vec{x}$  and  $\vec{y}$  be two vectors (in some-dimensional space) such that

$$\|\vec{x}\| = 1$$
,  $\|\vec{y}\| = 2$ , and  $\vec{x} \cdot \vec{y} = \sqrt{3}$ .

(a) Find the cosine of the angle between  $\vec{x}$  and  $\vec{y}$  (and the angle itself, if you know it).

$$||x|| ||y|| \cos \theta = x \cdot y$$

$$\cos \theta = (x \cdot y) / (||x|| ||y||)$$

$$= \sqrt{3}/2 = 0 \quad 0 = \pm \frac{\pi}{6}$$

(b) Tell me the values of the dot products  $\vec{x} \cdot \vec{x}$  and  $\vec{y} \cdot \vec{y}$ .

$$\vec{x} \cdot \vec{x} = ||\vec{x}||^2 = 1^2 = 1$$

$$\vec{y} \cdot \vec{y} = ||\vec{y}||^2 = 2^2 = 4$$

(c) Expand the expression  $(\vec{y} - \vec{x}) \cdot (\vec{y} - \vec{x})$  and use the result to find the distance between the points two points  $\vec{x}$  and  $\vec{y}$ .

$$||\vec{g} - \vec{x}||^2 = (\vec{g} - \vec{x}) \cdot (\vec{g} - \vec{x})$$

$$= \vec{g} \cdot \vec{g} - 2(\vec{x} \cdot \vec{g}) + \vec{x} \cdot \vec{x}$$

$$= 4 - 2\sqrt{3} + 1$$

$$= 5 - 2\sqrt{3}$$

$$=$$
  $||\vec{g} - \vec{x}|| = \sqrt{5 - 2\sqrt{3}}$ 

Problem 2. Consider the following system of 3 linear equations in 3 unknowns:

$$\begin{cases} x + y + 2z = -1 \\ x + 2y + 3z = 0 \\ 0 + y + z = 1 \end{cases}$$

(a) Put the system in reduced row echelon form (RREF).

(b) Use your answer from part (a) to write out the complete solution of the system.

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} -2 - t \\ 1 - t \\ t \end{pmatrix} = \begin{pmatrix} -2 \\ 1 \\ 0 \end{pmatrix} + t \begin{pmatrix} -1 \\ -1 \\ 1 \end{pmatrix}$$
This is a line in  $\mathbb{R}^3$ 

(c) Fill in the blanks: Geometrically, this system represents three \_\_\_\_\_\_\_ that intersect at a \_\_\_\_\_\_\_.

**Problem 3.** Now consider the modified system of 3 linear equations in 3 unknowns, where 
$$c$$
 is an arbitrary constant:

$$\begin{cases} x + y + 2z = -1 \\ x + 2y + 3z = 0 \\ 0 + y + z = c \end{cases}$$

(a) Put the system in upper-staircase form (you don't need to put it in RREF).

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
1 & 2 & 3 & | & 0 & | & B & -- & \\
0 & 1 & 1 & | & 1 & | & B & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & -1 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & A \\
0 & 1 & 1 & | & C
\end{pmatrix}$$

$$\begin{pmatrix}
1 & 1 & 2 & | & A \\
0$$

(b) Use part (a) to find all values of c such that the system has no solution.

(c) If c = 1 then we already saw in Problem 2 that the system has a solution. Use your solution to express the vector (-1, 0, 1) as a specific linear combination of the vectors (1, 1, 0), (1, 2, 1), and (2, 3, 1).

$$(-2-t)\begin{pmatrix}1\\1\\0\end{pmatrix}+(1-t)\begin{pmatrix}1\\2\\1\end{pmatrix}+t\begin{pmatrix}2\\3\\1\end{pmatrix}=\begin{pmatrix}-1\\0\\1\end{pmatrix}$$

**Problem 4.** Let A be a  $p \times q$  matrix (i.e. with p rows and q columns) and let B be an  $m \times n$  matrix (i.e. with m rows and n columns).

(a) Fill in the blanks:

We think of A as a function from A-dimensional space to A-dimensional space. We think of A as a function from A-dimensional space to A-dimensional space.

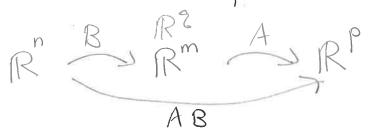

(b) Finish the sentence: The product matrix AB is defined only when ...

# columns of A = # nows of B

q = M

(c) Fill in the blanks: If the product matrix AB is defined then we think of it as a function from Y—-dimensional space to Y—-dimensional space.

(d) Finish the sentence: If the matrix AB is defined then its entry in the ith row and jth column is equal to ...

(ith row of A) · (ith col of B)

Problem 5. Consider the following two matrices and one vector:

$$A = \begin{pmatrix} 1 & 3 \\ 2 & 4 \end{pmatrix}, \qquad B = \begin{pmatrix} 1 & 1 & 0 \\ 0 & 2 & -1 \end{pmatrix}, \qquad \vec{x} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}.$$

(a) Find the vector  $B\vec{x}$  by computing the dot product of  $\vec{x}$  with the rows of B.

$$\begin{array}{ll}
\mathcal{R} \stackrel{?}{\times} &= \begin{pmatrix} 1 & 1 & 0 \\ 0 & 2 & -1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} \\
&= \begin{pmatrix} (1 & 1 & 0) \begin{pmatrix} x \\ y \\ z \end{pmatrix} \end{pmatrix} = \begin{pmatrix} x + y \\ 2y - z \end{pmatrix} \\
\begin{pmatrix} 0 & 2 - 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} x + y \\ 2y - z \end{pmatrix}.$$
(1) Figure the vector  $A(\mathcal{R}_{\overline{z}})$  are aligned some inetian of the solution of the solution of the solution of the solution of the solution.

(b) Express the vector  $A(B\vec{x})$  as a linear combination of the columns of A.

$$A(Bx) = {1 \ 3 \ 2 \ 4} {x+y \ 2y-z}$$

$$= (x+y) {1 \ 2} + (2y-z) {3 \ 4}$$

$$= (x+y) {4 \ 2x+2y} + (6y-3z) = (x+7y-3z) = (2x+10y-4z)$$

(c) Now find the matrix C such that for all numbers x, y, z we have  $C\vec{x} = A(B\vec{x})$ .

$$C\left(\frac{x}{2}\right) = \left(\frac{x + 7y - 3z}{2x + 10y - 4z}\right)$$

$$= C = \left(\frac{17 - 3}{210 - 4}\right).$$
