Thank You for the Opportunity to Speak

I've known Greg for many years, since I was a doctoral student working on Riemannian Geometry in the 1990's.

I am particularly grateful to Greg and to Jim, Gerhardt, Rick and Piotr for inviting me to serve as a visiting research professor at MSRI in 2013. That was a career altering opportunity for me.

All the work I am presenting here is a direct result of the time I spent there as I met both my collaborators, Carlos Vega and Anna Sakovich, at MSRI.

This is a flat spacetime with no gravity.

In General Relativity: Spacetime is a manifold M^4 endowed with a Lorentzian metric g of signature - + + +. The points in spacetime are still called events and every event has a light cone of null vectors, v with g(v, v) = 0, continuously oriented with a future and a past.

Example: $M^4 = (0, \pi) \times \mathbb{S}^3$ with $g = -dt^2 + \sin^2(t)g_{\mathbb{S}^3}$. There is a big bang and a big crunch in this spacetime.

In General Relativity: Spacetime is a manifold M^4 endowed with a Lorentzian metric g of signature - + + +. The points in spacetime are still called events and every event has a light cone of null vectors, v with g(v, v) = 0, continuously oriented with a future and a past.

Example: $M^4 = (0, \pi) \times \mathbb{S}^3$ with $g = -dt^2 + \sin^2(t)g_{\mathbb{S}^3}$. There is a big bang and a big crunch in this spacetime.

Again an event q is in the causal future of p, written $q \ge p$, iff there is a future directed causal curve, c, from p to q: $g(c'(s), c'(s)) \le 0 \quad \forall s$

 $M^4 = (a, b) \times N^3$ and $g = -dt^2 + f^2(t)g_N$ where N is a homogeneous Riemannian manifold of constant curvature, K.

In this simplified setting Einstein's Equations of General Relativity reduce to an ordinary differential equation for *f*.

When f increases the universe is said to expand. If f starts at 0 there is a big bang and if it ends at 0 there is a big crunch.

Friedmann–Lemaître–Robertson–Walker Spacetimes

FLRW spacetimes are used by cosmologists to model the universe. One assumes that

 $M^4 = (a, b) \times N^3$ and $g = -dt^2 + f^2(t)g_N$ where N is a homogeneous Riemannian manifold of constant curvature, K.

In this simplified setting Einstein's Equations of General Relativity reduce to an ordinary differential equation for f.

When f increases the universe is said to expand. If f starts at 0 there is a big bang and if it ends at 0 there is a big crunch.

While these models are very important in cosmology... they are an oversimplification of the observed universe. One may ask: How close is the true universe to these models? How close it the true universe to these models?

FLRW spacetimes are over simplified: $M^4 = (a, b) \times N^3$ and $g = -dt^2 + f^2(t)g_N$ because N^3 has constant curvature and matter is assumed to be distributed evenly.

Yet the real universe is known to have stars with gravity wells:

Is a large round universe filled with stars approximately a sphere?

How close it the true universe to these models?

FLRW spacetimes are over simplified: $M^4 = (a, b) \times N^3$ and $g = -dt^2 + f^2(t)g_N$ because N^3 has constant curvature and matter is assumed to be distributed evenly.

Yet the real universe is known to have stars with gravity wells:

Is a large round universe filled with stars approximately a sphere?

And what about black holes?

Even a universe with a single black hole cannot be considered to be close to an FLRW space, unless perhaps one cuts out the interior of the black hole along the horizon.

What does it mean to say the universe is "approximately" an FLRW spacetime when it has gravity wells and black holes?

What does it mean to say the universe is "approximately" an FLRW spacetime when it has gravity wells and black holes?

Concern: How can we measure the "distance" between two spacetimes which are not even diffeomorphic?

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

What does it mean to say the universe is "approximately" an FLRW spacetime when it has gravity wells and black holes?

Concern: How can we measure the "distance" between two spacetimes which are not even diffeomorphic?

Joint w/ Wenger: defined the intrinsic flat distance: $d_{\mathcal{F}}(M_1, M_2)$, between **Riemannian manifolds** which are not diffeomorphic.

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of rectifiable metric spaces. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming flat distance between the images $\varphi_j(M_j) \subset Z$.

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of rectifiable metric spaces. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming flat distance between the images $\varphi_i(M_i) \subset Z$.

Discussion with Andersson and Yau: Try to convert spacetimes, (M, g), canonically into metric spaces, (M, d), then take

 $d_{\mathcal{SF}}((M_1,g_1),(M_2,g_2)) = d_{\mathcal{F}}((M_1,d_1),(M_2,d_2)).$

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of rectifiable metric spaces. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming flat distance between the images $\varphi_i(M_i) \subset Z$.

Discussion with Andersson and Yau: Try to convert spacetimes, (M, g), canonically into metric spaces, (M, d), then take

$$d_{\mathcal{SF}}((M_1,g_1),(M_2,g_2)) = d_{\mathcal{F}}((M_1,d_1),(M_2,d_2)).$$

Maybe use Andersson-Galloway-Howard cosmological time, τ , to convert a Lorentzian metric g into a Riemannian metric $2d\tau^2 + g$

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of rectifiable metric spaces. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming flat distance between the images $\varphi_i(M_i) \subset Z$.

Discussion with Andersson and Yau: Try to convert spacetimes, (M, g), canonically into metric spaces, (M, d), then take

$$d_{\mathcal{SF}}((M_1,g_1),(M_2,g_2)) = d_{\mathcal{F}}((M_1,d_1),(M_2,d_2)).$$

Maybe use Andersson-Galloway-Howard cosmological time, τ , to convert a Lorentzian metric g into a Riemannian metric $2d\tau^2 + g$ Trouble: $\tau = \tau_{AGH}$ is not smooth so $d\tau^2$ is not defined!

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of rectifiable metric spaces. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming flat distance between the images $\varphi_i(M_i) \subset Z$.

Discussion with Andersson and Yau: Try to convert spacetimes, (M, g), canonically into metric spaces, (M, d), then take

Maybe use Andersson-Galloway-Howard cosmological time, τ , to convert a Lorentzian metric g into a Riemannian metric $2d\tau^2 + g$ Trouble: $\tau = \tau_{AGH}$ is not smooth so $d\tau^2$ is not defined!

Joint with Vega [CQG2016]: We introduce the null distance, \hat{d}_{τ} , on a spacetime, (M, g), endowed with a time function, τ . (a time function is strictly increasing along future causal curves)

The Null Distance between events in a Spacetime: $\hat{d}_{\tau}(p,q)$ Joint with Vega: Given a time function, τ , on a spacetime, (M,g),

$$\hat{d}_{ au}(p,q) = \inf_{eta} \hat{L}_{ au}(eta) = \inf_{eta} \sum_{i=1}^k | au(eta(t_i)) - au(eta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q, which are causal from $x_i = \beta(t_i)$ to $x_{i+1} = \beta(t_{i+1})$:

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{ au}(p,q) = \inf_{eta} \hat{L}_{ au}(eta) = \inf_{eta} \sum_{i=1}^{k} | au(eta(t_i)) - au(eta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q.

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{ au}(p,q) = \inf_{eta} \hat{L}_{ au}(eta) = \inf_{eta} \sum_{i=1}^{k} | au(eta(t_i)) - au(eta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Example: Minkowski Spacetime

The metric tensor is $g = -dt^2 + dx_1^2 + dx_2^2$ So if we take $\tau = t$ then the level sets of $\hat{d}_{\tau}(p, \cdot)$ are cylinders aligned perfectly with the light cones.

- 日本 本語 本 本 田 本 王 本 田 本

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{ au}(p,q) = \inf_{eta} \hat{L}_{ au}(eta) = \inf_{eta} \sum_{i=1}^{k} | au(eta(t_i)) - au(eta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Example: Minkowski Spacetime

The metric tensor is $g = -dt^2 + dx_1^2 + dx_2^2$ So if we take $\tau = t$ then the level sets of $\hat{d}_{\tau}(p, \cdot)$ are cylinders aligned perfectly with the light cones.

With $\tau = t$: *p* is in the future of $q \iff \hat{d}_{\tau}(p,q) = \tau(p) - \tau(q)$.

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{ au}(p,q) = \inf_{eta} \hat{L}_{ au}(eta) = \inf_{eta} \sum_{i=1}^k | au(eta(t_i)) - au(eta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Example: Minkowski Spacetime

The metric tensor is $g = -dt^2 + dx_1^2 + dx_2^2$ So if we take $\tau = t$ then the level sets of $\hat{d}_{\tau}(p, \cdot)$ are cylinders aligned perfectly with the light cones.

If we take $au = t^3$ then $\hat{d}_{ au}$ is not even a definite metric!

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{\tau}(p,q) = \inf_{eta} \hat{L}_{\tau}(eta) = \inf_{eta} \sum_{i=1}^{k} |\tau(eta(t_i)) - \tau(eta(t_{i+1}))|$$

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{\tau}(p,q) = \inf_{\beta} \hat{L}_{\tau}(\beta) = \inf_{\beta} \sum_{i=1}^{k} |\tau(\beta(t_i)) - \tau(\beta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Lemma: p is in the future of $q \implies \hat{d}_{\tau}(p,q) = \tau(p) - \tau(q)$. Definition: We say \hat{d}_{τ} encodes causality when this is \iff . Thm: If \hat{d}_{τ} encodes causality then (M, \hat{d}_{τ}) is a metric space. Lemma: \hat{d}_{τ} encodes causality on an FLRW spacetime $\tau = t$.

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{\tau}(p,q) = \inf_{\beta} \hat{L}_{\tau}(\beta) = \inf_{\beta} \sum_{i=1}^{k} |\tau(\beta(t_i)) - \tau(\beta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Lemma: p is in the future of $q \implies \hat{d}_{\tau}(p,q) = \tau(p) - \tau(q)$. Definition: We say \hat{d}_{τ} encodes causality when this is \iff . Thm: If \hat{d}_{τ} encodes causality then (M, \hat{d}_{τ}) is a metric space. Lemma: \hat{d}_{τ} encodes causality on an FLRW spacetime $\tau = t$.

Joint with Vega: Given a time function, τ , on a spacetime, (M, g),

$$\hat{d}_{\tau}(p,q) = \inf_{\beta} \hat{L}_{\tau}(\beta) = \inf_{\beta} \sum_{i=1}^{k} |\tau(\beta(t_i)) - \tau(\beta(t_{i+1}))|$$

where the inf is over all piecewise causal curves β from p to q. Lemma: p is in the future of $q \implies \hat{d}_{\tau}(p,q) = \tau(p) - \tau(q)$. Definition: We say \hat{d}_{τ} encodes causality when this is \iff . Thm: If \hat{d}_{τ} encodes causality then (M, \hat{d}_{τ}) is a metric space. Lemma: \hat{d}_{τ} encodes causality on an FLRW spacetime $\tau = t$.

So we can measure the d_{SIF} between two FLRW spacetimes by converting them to metric spaces and taking the d_F between them. But what about other spacetimes?

The Cosmological Time Function

Andersson-Galloway-Howard defined a time function which is independent of a particular gauge on a given spacetime (see also Wald-Yip):

Defn: $\tau_{AGH}(p)$ is the supremum of the Lorentz distance from p over all points q in its past. That is,

$$\tau_{AGH}(p) = \sup_{q \le p} \int_{c} \sqrt{-g(c'(s), c'(s))} \, ds$$

where c is a future causal curve from q to p. It is said to be "regular" if it is finite on all of M and converges to 0 on all past inextensible curves.

With Vega: If one defines the null distance using a regular cosmological time function, $\tau = \tau_{AGH}$, then it is a definite metric: $\hat{d}_{\tau}(p,q) = 0 \iff p = q$.

Open: Does it also encode causality? Are the charts biLip? Work in progress in this direction by B Allen and A Burtscher. Spacetime Intrinsic Flat Distances

between Big Bang Spacetimes [in progress with Vega]

Spacetime Intrinsic Flat Distances

between Big Bang Spacetimes [in progress with Vega] The classic Friedmann-Lemaître-Robertson-Walker spacetimes are warped product manifolds, with metric tensors $g = -dt^2 + f^2(t)h$.

They have a big bang iff t > 0 and $\lim_{t\to 0^+} f(t) = 0$.

Thm: \exists a single big bang point, p_0 , s.t. $\hat{d}_{\tau}(q, p_0) = \tau(q) \, \forall q \in M$.

We can then generalize the definition of big bang spacetimes to include all spacetimes with such a big bang point.

We then convert all such (M, g) into pointed metric spaces (M, \hat{d}_{τ}, p_0) canonically and uniquely.

We can then describe their spacetime intrinsic flat distance and the pointed intrinsic flat convergence of such spaces.

Thus we can achieve our goal: to understand what it means for the universe to be close to an FLRW space.

Spacetime Intrinsic Flat Distances between Maximal Developments [in progress with Sakovich]

Spacetime Intrinsic Flat Distances between

Maximal Developments [in progress with Sakovich] We consider spacetimes which are maximal developments of initial data sets solving Einstein's Equations [Choquet-Bruhat&Geroch].

Example: The Schwarzschild spacetime of mass m > 0 is

$$g_{Sch,m} = -\left(\frac{r^2 - 2mr}{r^2}\right) dt^2 + \left(\frac{r^2}{r^2 - 2mr}\right) dr^2 + r^2 g_{\mathbb{S}^2} \text{ with } r > 2m.$$

Here we have cut out the interior of the black hole along the horizon at r = 2m. The region t > 0 is the maximal development of the t = 0 level.

We study the cosmological time, $\tau = \tau_{AGH}$, and null distance, \hat{d}_{τ} on the t > 0 regions of Schwarzschild spacetimes (and Kerr spacetimes). We prove the spacetime intrinsic flat limits of these regions as $m \to 0$ is the t > 0 region in Minkowski spacetime.

Next we plan to study far more general maximal developments.

What spaces have a regular cosmological times?

These are questions for Lorentzian Geometers!!!

Meanwhile there is work on ${\mathcal F}$

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of Riemannian manifolds. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming **flat** distance between the images $\varphi_i(M_i) \subset Z$.

Meanwhile there is work on ${\mathcal F}$

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of Riemannian manifolds. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming **flat** distance between the images $\varphi_j(M_j) \subset Z$.

The **flat** distance between two submanifolds, $T_1, T_2 \subset Z$ is

 $d_F^Z(T_1, T_2) \le \inf \{ \operatorname{vol}_m(\mathsf{A}) + \operatorname{vol}_{m+1}(\mathsf{B}) : \mathsf{A} + \partial \mathsf{B} = T_1 - T_2 \},\$

Meanwhile there is work on ${\mathcal F}$

Joint with Wenger [JDG2011]: The intrinsic flat distance $d_{\mathcal{F}}(M_1, M_2)$ is defined between a pair of Riemannian manifolds. It is defined by taking the infimum over all distance preserving maps, $\varphi_j : M_j \to Z$ into all complete metric spaces, Z, of the Federer-Flemming **flat** distance between the images $\varphi_j(M_j) \subset Z$.

The **flat** distance between two submanifolds, $T_1, T_2 \subset Z$ is

 $d_F^Z(T_1, T_2) \le \inf \{ \operatorname{vol}_m(\mathsf{A}) + \operatorname{vol}_{m+1}(\mathsf{B}) : \mathsf{A} + \partial \mathsf{B} = T_1 - T_2 \},\$

Results on \mathcal{F} convergence:

Joint with Lakzian: Methods of estimating $d_{\mathcal{F}}(M_1, M_2)$ by finding $U_i \in M_i$ which are biLip close, and showing $vol(M_i \setminus U_i)$ is small, and $area(\partial U_i)$ and distance differences λ are controlled.

This was applied with Stavrov and will be applied with Sakovich.
